LOG4J VULNERABILITY ALERT

December 22, 2021

Issue:

This vulnerability allows an attacker to perform remote code execution by exploiting the insecure JNDI lookups feature exposed by the logging library log4j. This exploitable feature was enabled by default in many versions of the library. It is specifically version 2-2.15 that is affected.

Alert Status:

Valogix does not use Apache Log4j in any of our products. All Valogix versions are safe and not impacted by this vulnerability. At this time, there is no action or patching needed for Valogix.

* Please note that some older V7 customers using a Talend interface may have a log4j-1.x file within an internal interface directory. This file is part of the standard library delivered with the application, is not used by Valogix and is too old to be impacted by the current vulnerability.

Please reach out to our customer support team if there are any questions or concerns:

customersupport@valogix.com

For more information, please refer to the Apache log4j vulnerability page:

<https://logging.apache.org/log4j/2.x/security.html>

Sincerely,

Valogix Customer Support
